

# Information Extraction

# What is knowledge acquisition?

**Knowledge acquisition:** process to extract knowledge (to be integrated into knowledge bases) from unstructured text or other data

# Information Extraction

## **Two types of information extraction**

- Named Entity Recognition (NER)
- Relation Extraction (RE)

Sometimes in literature the task of relation extraction is referred to as information extraction. We keep the distinction between NER and RE

# Rough Accuracy of Information Extraction

Information type	Accuracy
Entities	90-98%
Attributes	80%
Relations	60-70%
Events	50-60%

- These are very rough, actually optimistic, numbers
  - Hold for well-established tasks, but lower for many specific/novel IE tasks

# Named Entity Recognition (intro)

Slides inspired by <http://web.stanford.edu/class/cs124/>

# Named Entity Recognition (NER)

- **Named entities:** Anything you can refer with a name to with a name
  - Locations, persons, organizations
  - Facilities, vehicles, songs, movies, products
  - Etc.
- **Named entity Recognition:** *find* and *classify* names in text, for example:

“The decision by the independent MP Andrew Wilkie to withdraw his support for the minority Labor government sounded dramatic but it should not further threaten its stability. When, after the 2010 election, Wilkie, Rob Oakeshott, Tony Windsor and the Greens agreed to support Labor, they gave just two guarantees: confidence and supply.”

# Named Entity Recognition (NER)

- **Named entities:** Anything you can refer with a name to with a name
  - Locations, persons, organizations
  - Facilities, vehicles, songs, movies, products
  - Etc.
- **Named entity Recognition:** *find* and *classify* names in text, for example:

“The decision by the independent MP **Andrew Wilkie** to withdraw his support for the minority **Labor** government sounded dramatic but it should not further threaten its stability. When, after the **2010** election, **Wilkie, Rob Oakeshott, Tony Windsor** and the **Greens** agreed to support **Labor**, they gave just two guarantees: confidence and supply.”

# Named Entity Recognition (NER)

- **Named entities:** Anything you can refer with a name to with a name
  - Locations, persons, organizations
  - Facilities, vehicles, songs, movies, products
  - Etc.

- **Named entity Recognition:** *find* and *classify* names in text, for example:

Person  
Date  
Location  
Organi-  
zation

“The decision by the independent MP **Andrew Wilkie** to withdraw his support for the minority **Labor** government sounded dramatic but it should not further threaten its stability. When, after the **2010** election, **Wilkie, Rob Oakeshott, Tony Windsor** and the **Greens** agreed to support **Labor**, they gave just two guarantees: confidence and supply.”

# Named Entity Recognition (NER)

- *Detecting entities is useful because*
  - Sentiment can be attributed to companies or products
  - A lot of relations are associations between named entities
  - For question answering, answers are often named entities
  - ...

# Named Entity Recognition (NER)

- *Like POS, also NER is sequence labeling problem*
- Three standard approaches
  1. Hand-written regular expressions
  2. Using classifiers
    - Generative: Naïve Bayes
    - Discriminative: Max entropy models
  3. Sequence models
    - Hidden Markov Models
    - CMMs (Conditional Markov Models) /MEMMs (Maximum Entropy Models)
    - CRFs (Conditional Random Fields)

# Named Entity Recognition (NER)

- Typically state-of-the-art Named Entity Recognizers can detect only *gross-grained* types of entities (e.g. Persons, Locations, Organizations)
- Some of the most popular ones
  - Stanford's NER (<http://nlp.stanford.edu/software/CRF-NER.shtml>) [1]
    - Uses a conditional random fields model
  - Apache OpenNLP (<https://opennlp.apache.org/>)
    - Uses a maximum entropy model
  - MALLET (<http://mallet.cs.umass.edu/>)
    - Uses a conditional random fields model
- Recently, large interest in using deep learning models (survey at [2])

[1] J. R. Finkel, T. Grenager, and C. Manning, "Incorporating Non-local Information into Information Extraction Systems by Gibbs Sampling," in *ACL*, 2005, pp. 363–370.

[2] Yadav, Vikas; Bethand, Steven. A Survey on Recent Advances in Named Entity Recognition from Deep Learning models. In *COLING* 2018

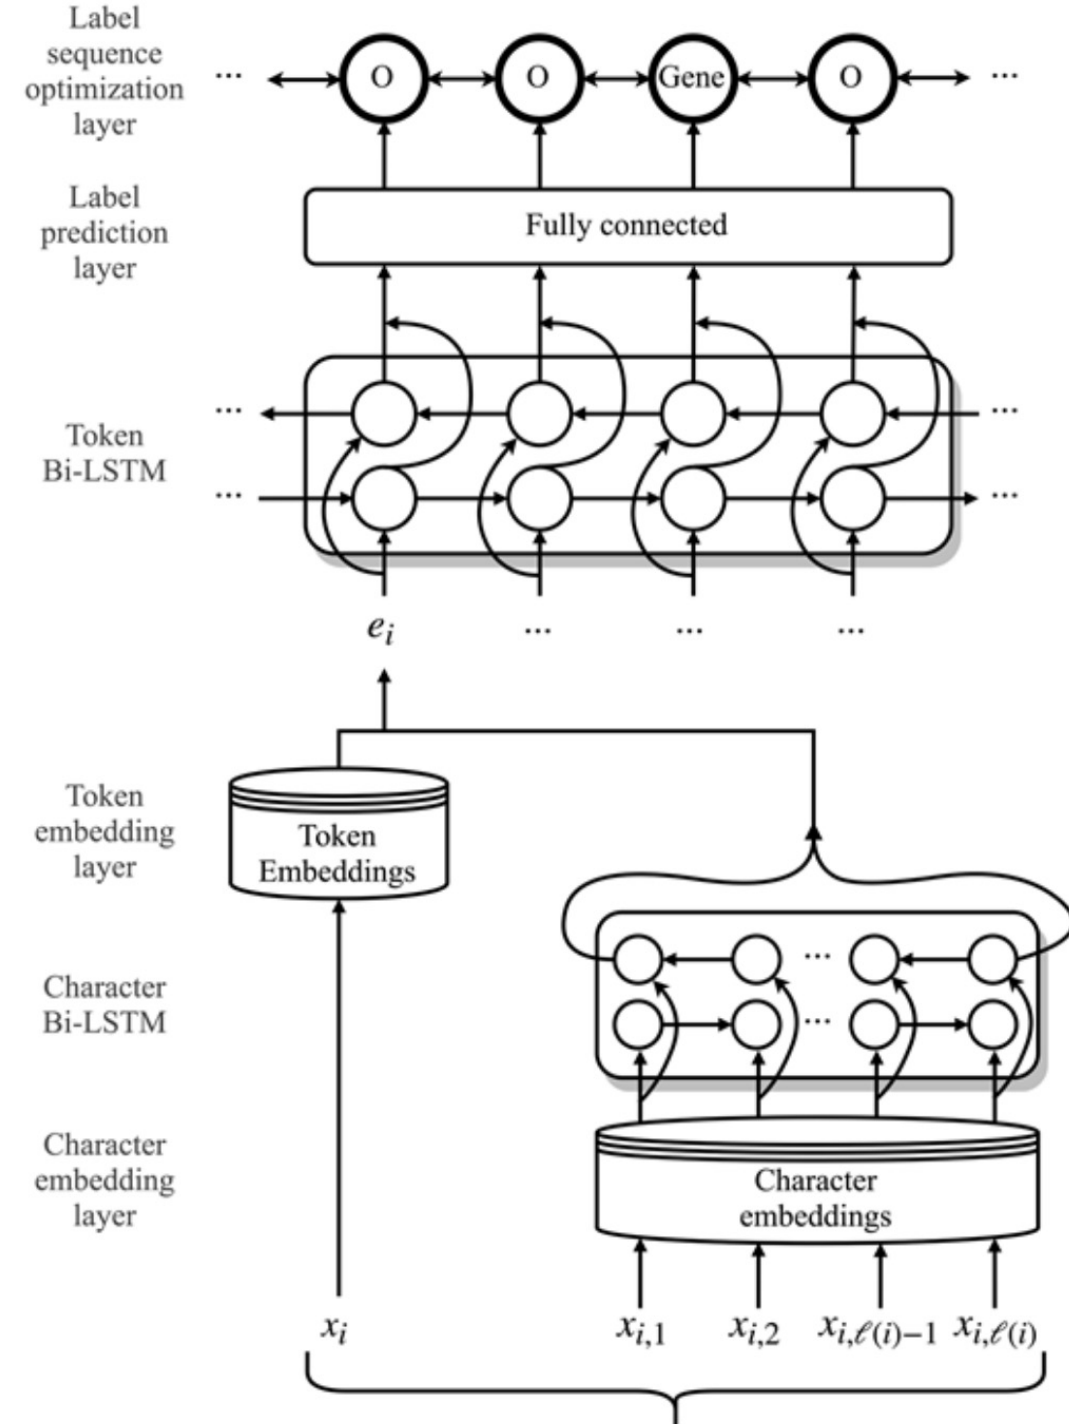

# NeuroNER [1]

- Uses BiLSTM for entity recognition
- Three layers
  - 1<sup>st</sup> layer: character-based embeddings concatenated with token-based embeddings
  - 2<sup>nd</sup> layer: Label prediction layer
  - 3<sup>rd</sup> layer: Sequence optimization layer

[1] Dernoncourt, Franck; Lee, Ji Young; Szolovits, Peter. NeuroNER: an easy-to-use program for named-entity recognition based on neural networks. ACL 2017

Figure from

<https://academic.oup.com/bioinformatics/article/34/23/4087/5026661>

# Token (Character) Embeddings

## Main idea

- Map every character, n-gram, token (word) into a vector of real numbers
- Vectors are coordinates into a high-dimensional space
- Learning algorithms compute embeddings so that “similar” words are mapped to “close” vectors

Male-Female

# LSTM

- **Long short-term memory (LSTM)** is arguably one of the most famous types of deep learning networks

# Problem

Given query mention in a source document,  
identify which Wikipedia entity it represents

# Problem

Example Query:

Northern Ireland has a population of about one and a half million people. At the time of partition in 1921 Protestants / unionists had a two-thirds majority in the region. The first Prime Minister of Northern Ireland, Sir James Craig, described the state as having 'a Protestant Parliament for a Protestant people.' The state effectively discriminated against Catholics in housing, jobs, and political representation.

## Northern Ireland

From Wikipedia, the free encyclopedia

*For the European Parliament constituency, see [Northern Ireland \(European Parliament constituency\)](#).*

**Northern Ireland** (Irish: *Tuaisceart Éireann*

pronounced [ˈt̪ˠu̐əf̪c̪əɾ̪ˠ t̪ˠeːɾˠəl̪ˠ] ( listen), **Ulster Scots**: *Norlin Airlann* or *Norlin Airlan*) is a part of the [United Kingdom](#) in the north-east of the island of [Ireland](#). It is variously described as a [country](#), [province](#) or [region](#) of the UK, amongst other terms.<sup>[3][4][5]</sup> Northern Ireland shares a border with the [Republic of Ireland](#) to the south and west. As of 2011, its population was 1,810,863,<sup>[2]</sup> constituting about 30% of the island's total population and about 3% of the [population of the United Kingdom](#). Since the signing of the [Good Friday Agreement](#) in 1998, Northern Ireland is largely self-governing. According to the agreement, Northern Ireland co-operates with the rest of Ireland – from which it was [partitioned in 1921](#) – on some policy areas, while other areas are [reserved](#) for the [Government of the United Kingdom](#), though the Republic of Ireland "may put forward views and proposals".<sup>[6]</sup>

Northern Ireland was for many years the site of a violent and bitter inter-communal conflict – [the Troubles](#) – which was caused by divisions between [nationalists](#), who see themselves as Irish and are predominantly Roman Catholic, and [unionists](#), who see themselves as British and are predominantly Protestant. (Additionally, people from both sides of the community may describe themselves as Northern Irish.)<sup>[7]</sup> Unionists want Northern Ireland to remain as a part of the United Kingdom,<sup>[8]</sup> while nationalists want [reunification](#) with the rest of Ireland, independent of British rule.<sup>[9][10][11][12]</sup> Since 1998, most of the paramilitary groups involved in the Troubles have ceased their armed campaigns.

[Northern Ireland](#) has traditionally been the most industrialised region of the island. After declining as a result of [political and](#)

# Entity Linking: Main Steps

- Task: find *one* mapping from entity **mentions** in the text to **entities** in the Knowledge Base (KB)
- Entity Linking consists of three main operations:
  - **Candidate Entity Generation**
  - **Candidate Entity Ranking**
  - **Unlinkable Mention Prediction**

# Candidate Entity Generation

# Candidate Entity Generation

- Goal: Link any entity mention to a set of candidates entities in the knowledge base
- Recall is important => If we miss some links, than we will never be able to recover
- **Three main techniques:**
  - Dictionary-based techniques
  - Surface form expansion
  - Based on search-engines

# Candidate Entity Generation

## Dictionary-based techniques

- The main idea is to construct an *offline* dictionary  $D$  between various names and the potential entities in the knowledge base
- **Wikipedia** is the most popular source to construct such vocabulary, so that methods that use it are sometimes referred to as “Wikipedia-based methods”
  - Entity pages
  - Redirect pages
  - Disambiguation pages
  - Bold phrases
  - Hyperlinks

# Candidate Entity Generation

## Dictionary-based techniques

- Wikipedia entity pages are pages that describe an entity
- The title is typically the name of the entity

### Stanford University

---

From Wikipedia, the free encyclopedia

*"Stanford" redirects here. For other uses, see [Stanford \(disambiguation\)](#).*

**Stanford University**, officially **Leland Stanford Junior University**,<sup>[8]</sup> is a [private research university](#) in [Stanford](#), [elsewhere](#).<sup>[7][9]</sup>

The university was founded in 1885 by [Leland](#) and [Jane Stanford](#) in memory of their only child, [Leland Stanford J](#) ago on October 1, 1891,<sup>[2][3]</sup> as a [coeducational](#) and [non-denominational](#) institution.

Stanford University struggled financially after Leland Stanford's death in 1893 and again after much of the campus be known as [Silicon Valley](#).<sup>[13]</sup> The rise of Silicon Valley helped Stanford become one of the world's most prestigious

There are three academic schools that have both undergraduate and graduate students and another four professional university, 476 individual championships, the most in Division I,<sup>[25]</sup> and has won the [NACDA Directors' Cup](#), recognized

Stanford faculty and alumni have founded a large number of companies that produce more than \$2.7 trillion in an of the [United States Congress](#) <sup>[48][49]</sup> Sixty Nobel laureates and seven Fields Medalists have been affiliated with s

# Candidate Entity Generation

## Dictionary-based techniques

**Stanford University**

---

From Wikipedia, the free encyclopedia

*"Stanford" redirects here. For other use*

# Candidate Entity Generation

## Dictionary-based techniques

- Disambiguation pages are used when the same name refer to different entities

### Stanford (disambiguation)

---

From Wikipedia, the free encyclopedia

**Stanford** may refer to:

#### Institutions [\[ edit \]](#)

---

- [Stanford University](#), in Palo Alto, California, United States
  - [Stanford Cardinal](#), the nickname of the athletic teams at Stanford University
- [Stanford Lake College](#), in Limpopo Province, South Africa

#### People [\[ edit \]](#)

# Candidate Entity Generation

## Dictionary-based techniques

- Bold phrases from the first paragraphs often refers to other names of the same entity

### Hewlett-Packard

---

From Wikipedia, the free encyclopedia

*This article is about the original company from 1939 to 2015. For the current company, see Hewlett-Packard Company.*

The **Hewlett-Packard Company** (commonly referred to as **HP**) was an American multinational technology company that manufactured a wide range of electronic components, computers, printers, and other devices. It was a major player in the personal computer market, competing with IBM and Apple. The company was also known for its work in the field of small businesses (SMBs) and large enterprises, including customers in the government, health care, and financial services industries.

The company was founded in a one-car garage in Palo Alto by William "Bill" Hewlett and David Packard. They were both engineers at the Stanford University and met while working on a project. They started the company in 1939, and it grew rapidly, becoming a public company in 1957. The company was known for its innovative products and its commitment to customer service. It was a major force in the development of the personal computer and the Internet. The company was acquired by the private equity firm Blackstone in 2015.

# Candidate Entity Generation

## Dictionary-based techniques

- Hyperlinks in Wikipedia articles contain anchor text that can be used as synonyms for a particular entity

... and [David "Dave" Packard](#), are  
delivering services. Major pro

# Candidate Entity Generation

## **Dictionary-based techniques**

- Entities mentions in text can be matched with the dictionary keys either using exact matching or with other string similarity measures
  - Dice score (# common bigrams)
  - Hamming distance (minimum number of substitutions to convert strings)
  - Etc.
- Sometimes entities are misspelled! There are algorithms to correct such cases

# Candidate Entity Generation

## **Surface form expansion**

- Some entity mentions are acronyms or part of the entities' full names
- We can use surface form expansion techniques to identify the real names
  - *Heuristic-based methods*
  - *Supervised learning methods*

# Candidate Entity Generation

## **Surface form expansion – Heuristic-based methods**

- We can search the text around the entity mention using pattern matching
  - University of Illinois at Urbana-Champaign (UIUC), HP (Hewlett-Packard)
- We can check for N continuous words (without stop words) that have the same initials than the acronym
- Michael I. Jordan => if “person” according to NER, then also “Jordan” refers to it

# Candidate Entity Generation

## **Surface form expansion – Supervised Learning Methods**

- Some acronyms are quite hard for heuristic based methods
  - E.g. DOD=Department of Defense
- We can use the extractions obtained with heuristics for training a supervised classifier (e.g. SVM). In literature the usage of such classifier improved the accuracy of 15.1% [1]

[1] W. Zhang, Y. C. Sim, J. Su, and C. L. Tan, “Entity Linking with Effective Acronym Expansion, Instance Selection, and Topic Modeling,” in *IJCAI*, 2011, vol. 2011, pp. 1909–1914.

# Candidate Entity Generation

## Based on search engines

- One simple idea is to query Google with the entity mention and check whether Wikipedia pages show up in the top-k positions
- Disadvantage: this method does not scale!
